HMW 5- Data 621

OMER OZEREN

Table of Contents

Summary

The goal of the homework is to test approaches for evaluating the data set containing various wine characteristics and to predict the number of cases ordered. This project includes comparison of linear, poisson, negative binomial regression models (including zero-inflated negative binomial model).

Data Exploration

The data set includes 12,795 observations with 14 variables (excluding the target variable).

Summary of Variables

Dictionary for Wine Data varianles:

- `AcidIndex`: Proprietary method of testing
- `Alcohol`: Alcohol content of wine.
- `Chlorides`: Chloride content of wine.
- `CitricAcid`: Citric acid content of wine.
- `Density`: Density of wine.
- `FixedAcidity`: Fixed Acidity of wine.
- `FreeSulfurDioxide`: Sulfur dioxide content of wine.
- `LabelAppeal`: Marketing score indicating the appeal of label design for consumers.
- `ResidualSugar`: Residual sugar of wine.
- `STARS`: Wine rating by a team of experts. Ranges from 1 (Poor) to 4 (Excellent) stars.
- `Sulphates`: Sulfate content of wine.
- `TotalSulfurDioxide`: Total sulfur dDioxide of wine.
- `VolatileAcidity`: Volatile acid content of wine.
- `pH`: pH of wine

The SUMMARY of Variables

Variable	Class	Min	Median	Mean	SD	Max
FixedAcidity	numeric	-18.1	6.9	7.076	6.318	34.4
VolatileAcidity	numeric	-2.79	0.28	0.3241	0.784	3.68
CitricAcid	numeric	-3.24	0.31	0.3084	0.8621	3.86
ResidualSugar	numeric	-127.8	3.9	5.419	33.75	141.2
Chlorides	numeric	-1.171	0.046	0.05482	0.3185	1.351
FreeSulfurDioxide	numeric	-555	30	30.85	148.7	623
TotalSulfurDioxide	numeric	-823	123	120.7	231.9	1057
Density	numeric	0.8881	0.9945	0.9942	0.02654	1.099
pH	numeric	0.48	3.2	3.208	0.6797	6.13
Sulphates	numeric	-3.13	0.5	0.5271	0.9321	4.24
Alcohol	numeric	-4.7	10.4	10.49	3.728	26.5
LabelAppeal	integer	-2	0	-0.009066	0.8911	2
AcidIndex	integer	4	8	7.773	1.324	17
STARS	integer	1	2	2.042	0.9025	4

Variable	Num of NAs	Num of Zeros	Num of Neg Values
FixedAcidity	0	39	1621
VolatileAcidity	0	18	2827
CitricAcid	0	115	2966

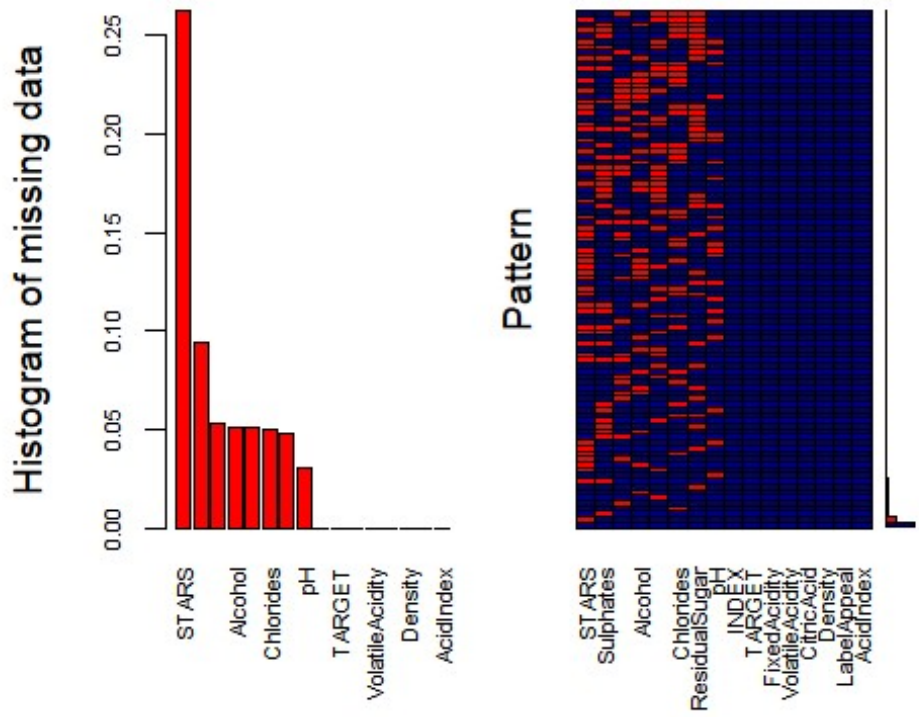
ResidualSugar	616	6	3136
Chlorides	638	5	3197
FreeSulfurDioxide	647	11	3036
TotalSulfurDioxide	682	7	2504
Density	0	0	0
pH	395	0	0
Sulphates	1210	22	2361
Alcohol	653	2	118
LabelAppeal	0	5617	3640
AcidIndex	0	0	0
STARS	3359	0	0

Chacteristics of Variables:

All but three independent variables are continous. Variables `LabelAppeal`, `AcidIndex` and `STARS` are categorical, but represented by numeric values in logical order.

Missing Values

Majority variables have negative values. Eight variables have some `NA` values. The plot and table below show how the missing values are spread out within the data set. About quarter of observations are missing a `STARS` value. The rest of variables contain missing values for at most 9.5% of observations.

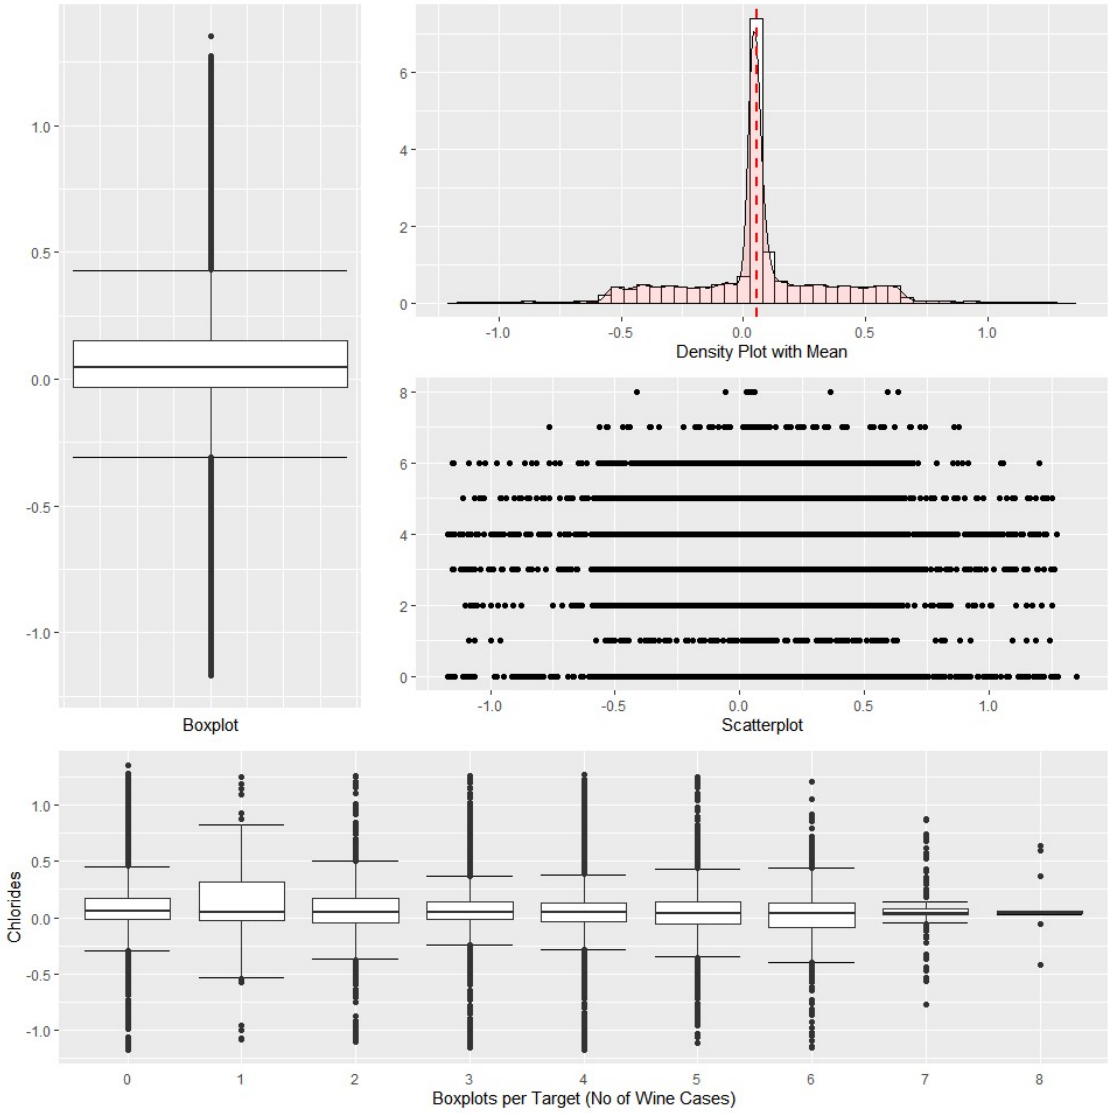


```
##
##  Variables sorted by number of missings:
##            Variable      Count
##               STARS 0.26252442
##           Sulphates 0.09456819
##  TotalSulfurDioxide 0.05330207
##             Alcohol 0.05103556
##   FreeSulfurDioxide 0.05056663
##            Chlorides 0.04986323
##       ResidualSugar 0.04814381
##                  pH 0.03087143
##               INDEX 0.00000000
##              TARGET 0.00000000
##        FixedAcidity 0.00000000
##     VolatileAcidity 0.00000000
##           CitricAcid 0.00000000
##              Density 0.00000000
##         LabelAppeal 0.00000000
##           AcidIndex 0.00000000
```

Plots

All dependent variables were inspected using boxplots, density plots and scatterplots. Distribution is similar for all variables - unimodal and symmetrical. Boxplots are also very similar across all possible outcomes with the exception of the last category - 8 cases purchased.

Plots below illustrate results for `Chlorides`.



Correlation Matrix

Correlation matrix below shows that there is very little correlation between variables.This is a good indicator for no-multicollineraity problem.

Dependent Variable

The dependent variable `TARGET` ranges from 0 (no cases purchased) to 8 cases of wine purchased. The most common outcome is 4 cases at 25% of all observations followed closely with no purchase (0 cases) at 21%. Not counting the 0 outcome, it seems that the variable has unimodal, symmetrical distribution resembling normal distibution centered around 4.

Outcome	No of Observations	Percent of Total
0	2734	0.21
1	244	0.02

2	1091	0.09
3	2611	0.2
4	3177	0.25
5	2014	0.16
6	765	0.06
7	142	0.01
8	17	0

Data Preparation

Two main areas to consider are missing and negative values.

Missing Values

The `STARS` variables contains 3,359 missing values. It represents ratings. **For this analysis missing values for `STARS` have been replaced with 0.**

Two other categorical variables - `LabelAppeal` and `AcidIndex` - do not have any missing values.

Other variables with missing values are good candidates for imputation. Imputation has been done using the `mice` R package and its method `norm`.

Negative Values

`Alcohol` variable has a few negative values - only 118 observations. Negative values for this variable are not possible since 0 would be a non-alcoholic beverage. **The variable has been transformed by taking absolute value of all observations.**

For other variables there is significantly more observations with negative values.

Training/Testing Split

Data set has been split into a training (75% of observations) and testing (25% of observations) sets. Splitting has been accomplished using the `caTools` R package based on the `TARGET` variable to make sure that each set has a proportional number of various target classes.

Modeling: Linear

Two main linear models developed were developed and analyzed. The first one included all available variables. It resulted in R^2 of 0.5268, RMSE of 1.3184 and accuracy in predicting the outcomes in the testing set of 0.2853. The second model used stepwise process in both directions to optimize the model (using the `stepAIC` function). It resulted in R^2 of 0.5266, RMSE of 1.3193 and accuracy of 0.2847. It appears that the full model performed very slightly better than the stepwise model.

Below is the summary of the full model.

```
##
## Call:

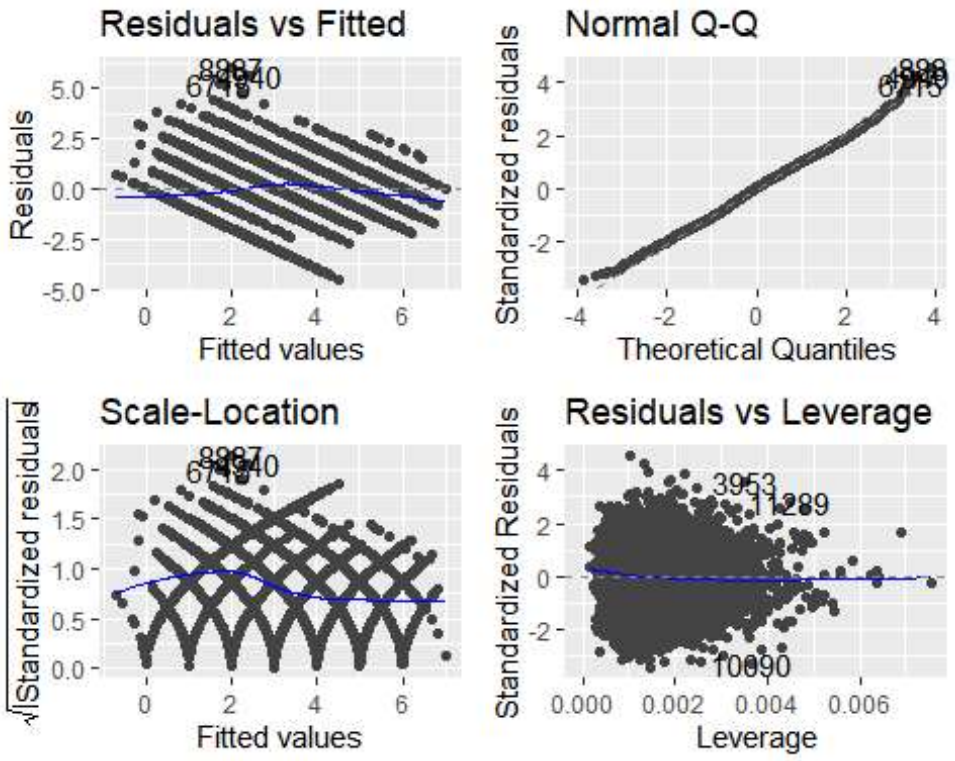
## Multiple R-squared:  0.5268, Adjusted R-squared:  0.5261
## F-statistic: 761.7 on 14 and 9580 DF,  p-value: < 2.2e-16
```

Looking at the diagnostic plots we can see that the model performs reasonably well.



The accuracy is fairly low at 28.53%; however, if we examine full confusion matrix below we can see that the model mostly errors only by 1 or 2 cases which may be reasonable enough for a business application.

```

Modeling: Poisson

The linear model seemed to perform good with all variables. So for the poisson regression similar strategy was applied - a model with all variables and a model optimized by the stepwise method.RMSE for this model is 1.39855, slightly worse than for the linear model.

```
##
## Call:
## glm(formula = TARGET ~ . - INDEX, family = poisson, data = wineTRAIN)

Modeling: Negative Binomial

Using the `MASS` R package, negative binomial model was created using all variables. This model turned out to be nearly identical to the poisson model.

Modeling: Zero-Inflated Negative Binomial

Poisson and negative binomial models do not account for the 0 outcome. So a zero-inflated negative binomial model was attempted using the `pscl` R package. RMSE for this model is 1.2727, the best one out of all models.

```

```

This model has the accuracy of 35.78%, again the best one out of all models. It predicts 0 outcomes (not ideally, but perhaps it can be improved with more research).

```

```

Model Comparison

Considering log-likelihood of all models, it is clear that zero-inflated negative binomial model is the best option. More research in that direction will probably be beneficial.

	Log-Likelihood	DF
Linear	-16316	16
Poisson	-17507	15
NB	-17507	16
ZINB	-15303	31

Using full models in all methods allows comparison of coefficients. For the most part coefficients are similar in sign and in magnitude. There are a couple of small coefficients that change signs between NB and ZINB models.

	Linear	Poisson	NB	ZINB (Count)
(Intercept)	3.674	1.416	1.416	1.387
FixedAcidity	0.000174	-0.000285	-0.000285	0.000323
